

Generic User Mapper

Aras Innovator has the flexibility to provide many options to administrators when controlling the maintenance of user logins by providing multiple external authentication options. A User Mapper must be created for each external authentication that maps an external user to an Aras Innovator user. Each external authentication has its own user format, so it is important that the User Mapper can handle any user format. The Generic User Mapper can flexibly configure mapping an external user to an Aras Innovator user for multiple authentication types.

The Generic User Mapper customizes the user mapping process during external login. This plugin provides a flexible configuration that allows it to be used with any authentication type.

A Transformation mechanism can be used to make changes to the configuration. For more information, refer to the [Example: Setup of Aras Innovator SAML 2.0 Authentication with Azure as Identity Provider](#) section.
