

OnInsert Event

The **OnInsert** event is triggered after an item has been inserted into a collection control. The event handler receives the details of the inserted item through the `eventData` object, which is available within the scope of the event handler code.

// Accessing data of inserted item

```
const insertedItemCount = eventData.length;
for (let i = 0; i < insertedItemCount; i++) {
```

// accessing data of selected item

```
    const relationshipId = eventData[i].getItemId();
    const relatedItemId = eventData[i].getRelatedId();
    const partWeight = eventData[i].getValue("weight");
```

// setting a cell value on inserted item

```
    eventData[i].setValue("classification", "item");
}
```
