

# Overview

The **Change Process Definition** serves as the primary configuration item for managing Change Items within the Aras Unified Change Management application. It enables the configurable behavior of specific context Change item types, such as **Change Requests** and **Change Orders**, as well as **Change Tasks** within the Change Orders. Key components associated with the Change Process Definition include:

- **Change Actions:** These define the selectable actions, such as *Release*, *Revise*, or *Obsolete*, for the affected items of a Change Item.
- **Automations:** These enable the configuration of validations and automated actions applied to Change Items and/or their affected items, streamlining and enhancing process efficiency.
