

# Pipelines

A **Pipeline** is a set of automated processes that allow developers to consistently and reliably build, test, and deploy their code.

Aras provides the following set of **Pipelines**:

1. **ContinuousIntegration**: This **Pipeline** runs a Build given a **Commit** in the Git **Repo**. The system triggers it in one of the following ways:
  - o Validation for a **Branch**.
  - o Validation for a **Pull request**.
  - o Request by a DevOps user.Typically, the Continuous Integration (CI) **Pipeline** is not manually initiated; it is automatically triggered by actions such as **Pull requests (PRs)** and mergers governed by **Branch** policies.
2. **DeployToSIT**: This **Pipeline** creates a Deployment **Package** from a Build, deploys it to the SIT environment, and stores a copy in the **Artifacts** storage.
3. **DeleteInnovator**: This **Pipeline** deletes a given test instance in the SIT environment.
4. **GenerateBaseline**: Generating **Baselines** establishes a starting point and facilitates tracking project changes. This **Pipeline** generates a new **Baseline** and stores the **Artifact** in the **Artifact** storage.
